## Anterior Circulation with Bifurcation Stenosis

Ref: H+N-S-S-050 and H+N-S-S-004

### Head & Neck Flexible

Right flexible carotid artery model with a carotid bifurcation stenosis. This model is ideally combined with an aortic arch model, T-R-N-001/002 or T-S-N-001/002. The carotid bifurcation segment is easily exchanged with other carotid models to simulate different degrees of atheromatous stenosis.

Stenosis simulation

Ref: H+N-S-S-050

This model comes with 3 exchangeable bifurcation segments (Ref: H+N-S-S-004 or 005). Refill models are available in sets of five units (Ref: H+N-S-S-504 or 505). This model satisfies the need for preclinical medical training and device evaluation for PTA and stent use at this level of the vascular tree.

Side view

ELASTRAT in vitro models respect human cerebrovascular complexity and provide a realistic environment for the development of new products, the simulation of endovascular procedures, pre surgery training, studies and teaching purposes.

The carotid bifurcation comes in 2 different inner diameters: H+N-S-S-004 in 4mm or H+N-S-S-005 in 5mm.

Ref: H+N-S-S-005

ELASTRAT in vitro models are compatible with modern imaging modalities such as digital subtraction angiography, computed tomography and magnetic resonance imaging. Providing the use of an adequate circulating fluid, Doppler techniques can also be performed. The in vitro models transparency to light makes them suitable for video and photographic monitoring.
